

Heat Reflective Technology

Thermoflect - Patient Warming Garments

Thermoflect Heat Reflective Technology is the simple, safe and effective solution for preventing hypothermia and maintaining normothermia.

Today's fast-paced surgical environment needs products that work, not products that make work. Thermoflect heat reflective technology products are simple, safe and effective. They begin working from the moment they are applied to bank heat and help prevent redistribution temperature drop [RTD]. They use science instead of electricity and are the most efficient and cost-effective prewarming products available.

Patient Warming Garments

The Thermoflect Total Access Gown is designed to provide maximum access to the surgical patient without compromising the benefits of patient warming. The unique 360 degree release strip provides quick separation for access to the surgical site and simple repositioning for transport to PACU. This multi-function gown can be easily configured in the four positions below as well as a multitude of others to address the specific needs of procedural positioning.

- Full Length for prewarming and recovery
- Open Arm for chest or breast surgery
- Upper Body Blanket for abdominal or lower body procedures
- Lower Body Blanket for abdominal or upper body procedures
